

**AMENDMENTS TO THE ABSTRACT:**

Please amend the original abstract as follows:

The optical system of a projection display apparatus, ~~comprises~~ The projection display apparatus includes a light source, a prism, a light valve, and a projection lens. ~~Wherein-a~~ A light beam ~~emitting~~ emitted from the light source impinges into the prism[[,]] and passes through the first surface of the prism directly to illuminate the light valve which is placed near the first surface and parallels the first surface. By the reflection of the light valve, the light beam impinges into the first surface again, and illuminates a total internal reflection surface with an incidental angle large than the critical total reflection angle, so as to reflect the light beam out of the second surface of the prism and impinge to projection lens to form an image. Therefore, the optical system can increase the transmission and decrease the number of components, and ~~the~~ reduce its overall volume of it ~~will be more compact~~.
